Hi Matt,

It was a pleasure speaking with you at the Esri User Conference! Altitude by Geotab delivers advanced planning solutions that help improve the safety, sustainability, efficiency, equity, and profitability of infrastructure supporting mobility. To further illustrate the power of these insights, we've just published a new report: "[How efficient is your city's freight network?](#)".

This report introduces the Altitude Freight Efficiency Score, a unique metric developed from anonymized, aggregated commercial vehicle movement data. It quantifies how smoothly freight moves through urban areas by evaluating three key aspects of a city's transportation network:

- **Infrastructure Readiness:** Measures the ease of commercial vehicle movement, emphasizing travel time increases caused by congestion and the predictability of that congestion.
- **Infrastructure Resilience:** Assesses the transportation system's ability to recover from both planned and unplanned abnormalities, such as busy sporting events or severe weather.
- **Infrastructure Externalities:** Measures waste produced by vehicles, with a focus on idling time, which impacts fuel consumption and air quality.

You'll discover key findings, such as how cities like Denver and Chicago demonstrate higher overall freight efficiency, excelling in a combination of factors including lower congestion, strong recovery capabilities, and reduced idling. The report also highlights cities like Los Angeles and New York, which face significant challenges in infrastructure readiness due to high congestion.

We believe the insights within this report will be incredibly valuable to you and your organization as you work to:

- Identify specific areas for improvement within your transportation infrastructure.
- Make informed decisions for critical infrastructure and transportation planning.

- Strengthen funding applications by demonstrating a clear, data-driven understanding of your needs.
