Hi Felix,

Thank you for downloading our "**Outlining the Path Toward Trucking Electrification**" report. We trust that you found the insights into medium-duty (MD) and heavy-duty (HD) truck electrifiability valuable.

The report highlighted that many trucks already have daily driving patterns well-suited for electrification, especially with depot charging access. For instance, **58% of MD trucks and 41% of HD trucks are electrifiable with a 250-mile range and depot charging.** This demonstrates that driving range often isn't the limiting factor; it's about understanding the current operational behaviors and identifying optimal charging strategies.

Altitude by Geotab offers contextualized transportation insights derived from billions of data points, helping you to:

- **Quantify electrification potential:** Understand which of your trucks are best candidates for electrification based on their real-world duty cycles.
- **Identify ideal charging locations:** Pinpoint high-frequency, long-duration stop locations that could serve as future charging station sites, reducing the financial burden of infrastructure.

We're committed to helping you navigate the complexities of trucking electrification with data-driven confidence.
